

BypassInvoice

Introduction

BypassInvoice allows for the delegation of the management and numbering of PrestaShop invoices to Dolibarr, simplifying billing and data synchronization, and offering an efficient solution for merchants looking to optimize their accounting processes and provide a better customer experience.

Features

- Two operating modes: Exclusive Mode for complete invoice management via Dolibarr and Duo Mode for invoice number management in synchronization with PrestaShop.
- Automation of invoice creation in Dolibarr following paid orders on PrestaShop.
- Automation of third-party creation in Dolibarr following paid orders on PrestaShop.
- Automation of billing address creation in Dolibarr following paid orders on PrestaShop.
- Management of deferred payments allowing the creation of invoices without immediate payment.
- Synchronization of invoice numbers between PrestaShop and Dolibarr for accounting consistency.
- Customization of invoice display in the PrestaShop customer area.

Prerequisites

- PrestaShop: Compatible version (e.g., 1.7.x or higher).
- Dolibarr: Compatible version (e.g., 14.x or higher) with API access configured.
- Administration Rights: Administrator access on both PrestaShop and Dolibarr.

Module condition:

- In Dolibarr, each third-party entity must have a unique email address. When BypassInvoice searches for a third party in Dolibarr, it first checks the SIRET number before relying on the email address. If no matching third party is found, a new third party is then created in Dolibarr.
- To perform a decrement of your stocks with Dolibarr, the barcode or product reference must match exactly between Dolibarr and PrestaShop.

Installation

1. Download the BypassInvoice module installation file.
2. Log in to your PrestaShop admin area.
3. Go to "Modules" > "Module Manager" and select "Upload a module".
4. Select the installation file and let the module install automatically.
5. Activate the module from your dashboard.

Configuration After installing the BypassInvoice module, you need to configure it to work correctly with your Dolibarr instance. Here's a detailed overview of the available options in the module configuration:

Exclusive Mode

- Disable the native billing function of PrestaShop.
- Configure the module to transfer all billing operations to Dolibarr.
- Customize the display of invoices in the PrestaShop customer area.

Duo Mode

- Maintain invoice creation in PrestaShop.
- Configure the module to transfer all billing operations to Dolibarr.
- Configure the invoice number format to be identical between Dolibarr and PrestaShop.

The module simply generates an invoice in Dolibarr before transferring the invoice number to PrestaShop, thereby allowing the latter to produce its own invoice in its specific format.

Detailed Options BypassInvoice

Enable or disable the module:

This option allows you to temporarily suspend or activate the BypassInvoice functionality without having to uninstall the module. Even when the module is disabled, your customers will continue to have access to their invoice history in their customer area. This approach allows flexibility in managing the module while preserving user experience continuity.

Error Logs

- **Manage log activation:** Enable this option to record errors and important operations in a log file. This can be crucial for debugging and system maintenance. Log files are stored in `/modules/bypassinvoice/logs`. For quick consultation, a direct link to the log file is provided at the top of the module configuration page.

API Key

- **Enter your Dolibarr instance's API key:** The API key is essential for authenticating and authorizing secure communications between PrestaShop and Dolibarr. You must generate this key in your Dolibarr instance and enter it here. [URL](#)

URL of your Dolibarr instance:

- **Specify the complete URL where your Dolibarr is installed.** This information allows the BypassInvoice module to correctly connect to Dolibarr for data transmission.

ENTITY

- **Dolibarr entity concerned:** If you are using Dolibarr to manage multiple companies, specify here the identifier of the entity concerned by the module's operations. By default, this parameter is set to 1.

Credit Card Payment

- Mapping of credit card payment with Dolibarr: Configure this option to associate credit card payments made on PrestaShop with the corresponding payment type in Dolibarr.

BANK

- Destination bank for payments: Select the bank within Dolibarr where payments made on PrestaShop should be recorded. This option is useful to ensure that transactions are correctly allocated in your Dolibarr accounting.

Warehouse

- Default warehouse selection for stock management: Determine which warehouse in Dolibarr will be used for the automatic deduction of stocks following sales made on PrestaShop. This setup helps maintain accurate stock levels between the two systems. Make sure that product references are identical between Dolibarr and PrestaShop. BypassInvoice initially checks for similarities at the EAN13 barcode level; in the absence of a match, it then checks the product reference.

Credit note

- Turn on or off credit notes specifically for products. (enables the creation of credit notes and their dispatch to Dolibarr)

Billing Account Block (present only in exclusive mode)

Display Dolibarr invoices

- Integrates a block for Dolibarr invoices in the PrestaShop customer area.

Display all Dolibarr invoices

- Choice between displaying all invoices or only those related to PrestaShop orders.

Title of the page and customer area block

- Customization of the title for the invoice block (e.g., "Invoices").

PDF Invoice Template

- Selection of the PDF model for invoices generated by Dolibarr (e.g., "crab").

Invoice Number Customization (Options for Duo Mode)

These options offer significant flexibility in customizing the format of invoice numbers generated as part of BypassInvoice's Duo Mode, ensuring that numbering aligns precisely with the specific accounting and tracking needs of the business.

Year in Invoice Number

- Enabled: Incorporates the current year in the invoice number for easier chronological tracking.
- Disabled: Omits the year from the invoice number format for a more concise numbering.

Month in Invoice Number

- Enabled: Adds the current month to the invoice number, offering additional temporal granularity.
- Disabled: Excludes the month to simplify the invoice number.

Short Date

- Enabled: Uses a shortened representation of the date (e.g., "2401" for January 24) in the invoice number.
- Disabled: Prefers a numbering format without detailed date specification.

Separation Character

- Separator between the Date and Invoice Number: Allows defining a specific character (such as a dash, dot, or slash) to separate the date elements from the rest of the invoice number, thus enhancing readability.

Length of Invoice Number

- Definition of the Invoice Number Length: Specify the total length of the invoice number, allowing for standardization and consistency, especially for alignment of filing and invoice storage systems.

Usage Invoice Creation

Invoices, clients (third parties), billing addresses, and payments are automatically generated in Dolibarr as soon as an order is settled on PrestaShop. For payments made by check, the creation of the invoice in Dolibarr is triggered automatically once the order status is updated as "payment accepted".

- Invoice numbers are synchronized between the two systems according to the chosen operating mode.

Invoice Settings with Deferred

Payments Status without payment

- Configure the status assigned to orders that do not require immediate payment. When a customer opts for this payment mode, no payment record will be transmitted to Dolibarr, even if the order status evolves to a state indicating that payment has been accepted.

Payment conditions assigned for this status

- Specify the payment terms that should be applied to orders identified by a status indicating a deferred payment. Ensure these terms are aligned with the payment options previously established in Dolibarr. An invoice generated under this specific status will exclusively use these determined payment conditions.

FAQ

This section should answer frequently asked questions about the installation, configuration, and use of BypassInvoice, as well as common issues and their solutions.

Question: How can I restore the default invoice numbering of PrestaShop if the invoice activation option does not seem to work?

Answer: To restore the original invoice numbering in PrestaShop, you need to activate the "Enable Invoice" option. Then, enter the value "0" in the "Invoice Number" field before saving your changes.

Question: Why are my stocks not decrementing in Dolibarr when an invoice is generated?

Answer: To ensure that stocks are correctly decremented in Dolibarr upon validation of invoices or customer credits, go to the "Stock" module in Dolibarr. There, you will find an option titled "Decrement physical stocks on invoice/customer credit validation". Make sure this option is selected to activate the automatic update of your stocks.

Answer: Ensure that product references are identical between Dolibarr and PrestaShop. BypassInvoice initially checks for similarities at the level of EAN13 barcodes; in the absence of a match, it then checks the product reference.

Question: Why do some invoices in Dolibarr display product lines in bold?

Answer: The appearance of product lines in bold on an invoice in Dolibarr signals an unidentified product in your catalog. It's important to verify the match between the references or barcode numbers used in PrestaShop and those recorded in Dolibarr to ensure the accuracy of data between the two systems.

Support

For any additional assistance, please contact technical support via the email provided at the time of module purchase or through the support system in your PrestaShop customer area. Be sure to include detailed information about your issue for a quick resolution. We also recommend attaching relevant log files; a link to download these logs is made available in the module configuration section.
